

Disaster Digitalization, not so bad after all?

Some people think that digitization is a bad thing, but it brings quite a few benefits that some may not expect.

Digitization in schools

After starting school, in the age of digitalization, people are continuously introduced to technical devices, applications and social media. In the IT subject, for example, I learned early on how to use Excel, Word and PowerPoint.

Digitization is particularly evident in the way students communicate with each other. Almost everyone interacts with their classmates via WhatsApp.

Digitization in private life

Nowadays, communication in private life often takes place via various messengers. Digitalization makes it possible to keep in touch with friends and family on a daily basis, even when they are not around at the moment.

Digitization in the world of work

Since I started my training only a year ago, new impressions of digitization continue to affect me. Kind of unfamiliar at first, but in a way, not! E.g. sending documents via email or the search for people in Outlook, like on Facebook, to get information from other employees without having to ask all the time. MS Teams reminds me a lot of video calls, chats and groups that are also used in school.

Digital communication makes a lot of things easier at work as it does in our personal lives. A life without these technical possibilities would be unfavorable and meanwhile unthinkable for me. I am pleased that modern communication options also make working life easier.

All in all, the digital education since school days has not been as disastrous as I thought.
